2017A3PS0445P: DESAI MOHIL SANDIP

2017A3PS0823P: AADARSH MOHTA

PROBLEM STATEMENT:

This system senses the speed at which the fan is rotating and adjusts the speed, based on the user input. The user can select three different speeds of the fan. The current speed should be sensed and the control mechanism should gradually increase the speed to the desired speed.

User Interface:

1. Fan starts when user presses 'Start' button.
2. User can then set the required speed by using a keypad interface. This speed value should be displayed on the display.
3. After setting speed initially, user should be able to change the fan speed setting by an up and down switch. Each press on this arrow button increases/ decreases the speed by 1 unit. Min speed value is 1, whereas maximum speed value is 5 Units. Pressing 'UP' button after reaching to value 5, should not change the display value or setting of fan speed. Same is true for lower bound.
4. Fan can be stopped by pressing 'Stop' button.
5. User can also set the mode of fan as 'Auto' mode besides a 'Regular mode' setting.

In Auto mode, user should be able to enter the value of time in terms of hours after which the fan has to be switched off automatically. (For example, if value entered is 2, then the fan should switch off after 2 hours from the time this setting is applied.

ASSUMPTIONS:

- 1) CLK pin of the micro-processor is connected to a reliable clock generator to produce waveform of suitable frequency.
- 2) User can start the fan only by pressing the start button. No other key will function until the fan has been started.
- 3) The fan starts at speed 1 on press of the start button.
- 4) Pressing the start button after the fan has started results in no change of the system state.
- 5) Auto mode allows users to enter numbers from 0 to 3. (Can be extended)
- 6) After time in auto mode has lapsed, user can move to regular mode by pressing the auto button again or by pressing stop followed by start.
- 7) Stop time (in hours) has to be set before the auto key has been pressed.
- 8) Fan speed can be set only once using keys numbered 1-5 after the fan has been switched on.

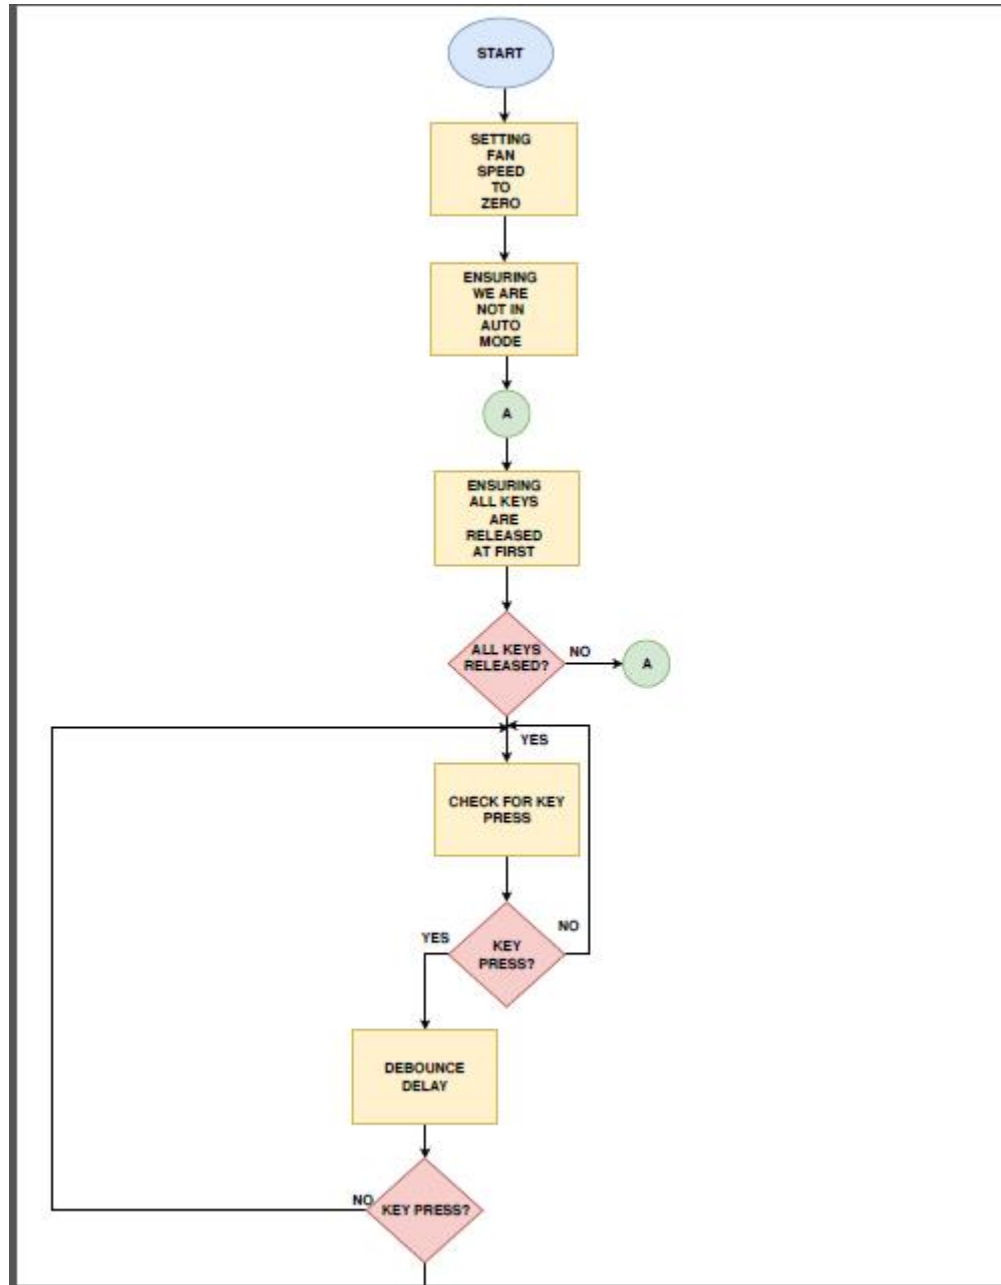

List of components used:

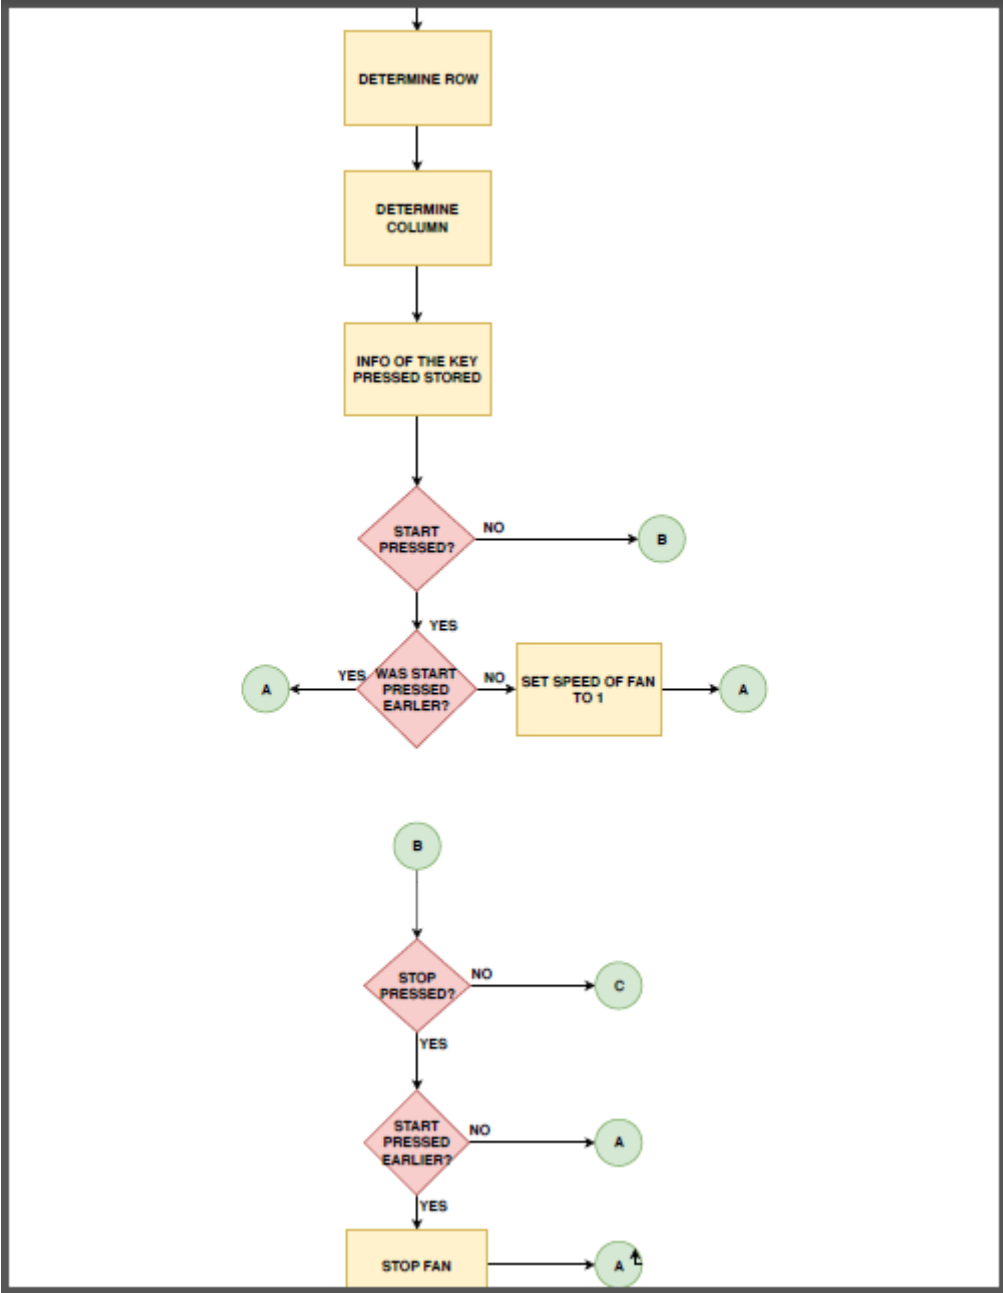

- 1) 8086 Micro-Processor = 1
- 2) 74LS373 Octal Latches = 3
- 3) 8255A Programmable Peripheral Interfacing Device = 2
- 4) 74LS107 J-K flip flops = 3
- 5) 7SEG-BCD Display = 2
- 6) DAC_8 Digital to Analog Converter = 1
- 7) DC Fan = 1
- 8) Push Button Switches = 11
- 9) 74LS245 Bi-Directional Buffer = 2
- 10) 74LS244 Unidirectional Buffer=1
- 11) 2732 ROM Chips (4KB each) = 2
- 12) 6116 RAM Chips (2KB each) = 2
- 13) OR Gates = 12
- 14) NOT Gates = 4
- 15) NAND Gates = 1
- 16) AND Gates = 9
- 17) 8253A Clock generator
- 18) Ground Terminal = as required
- 19) DC Voltage Sources = as required
- 20) Buses = as required

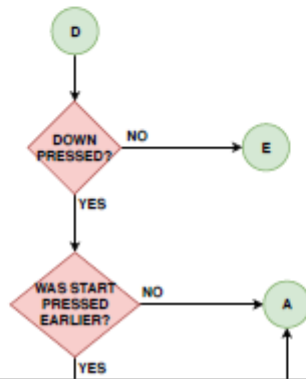

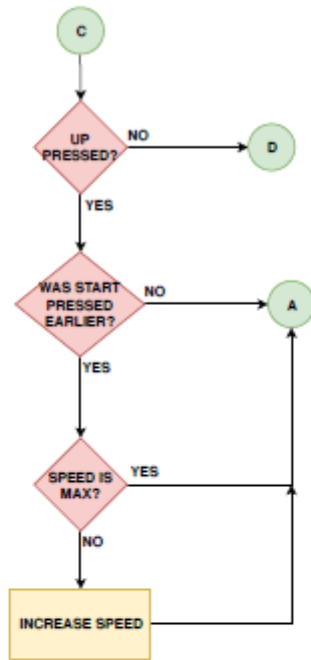

Complete address mapping of memory and I/O devices:

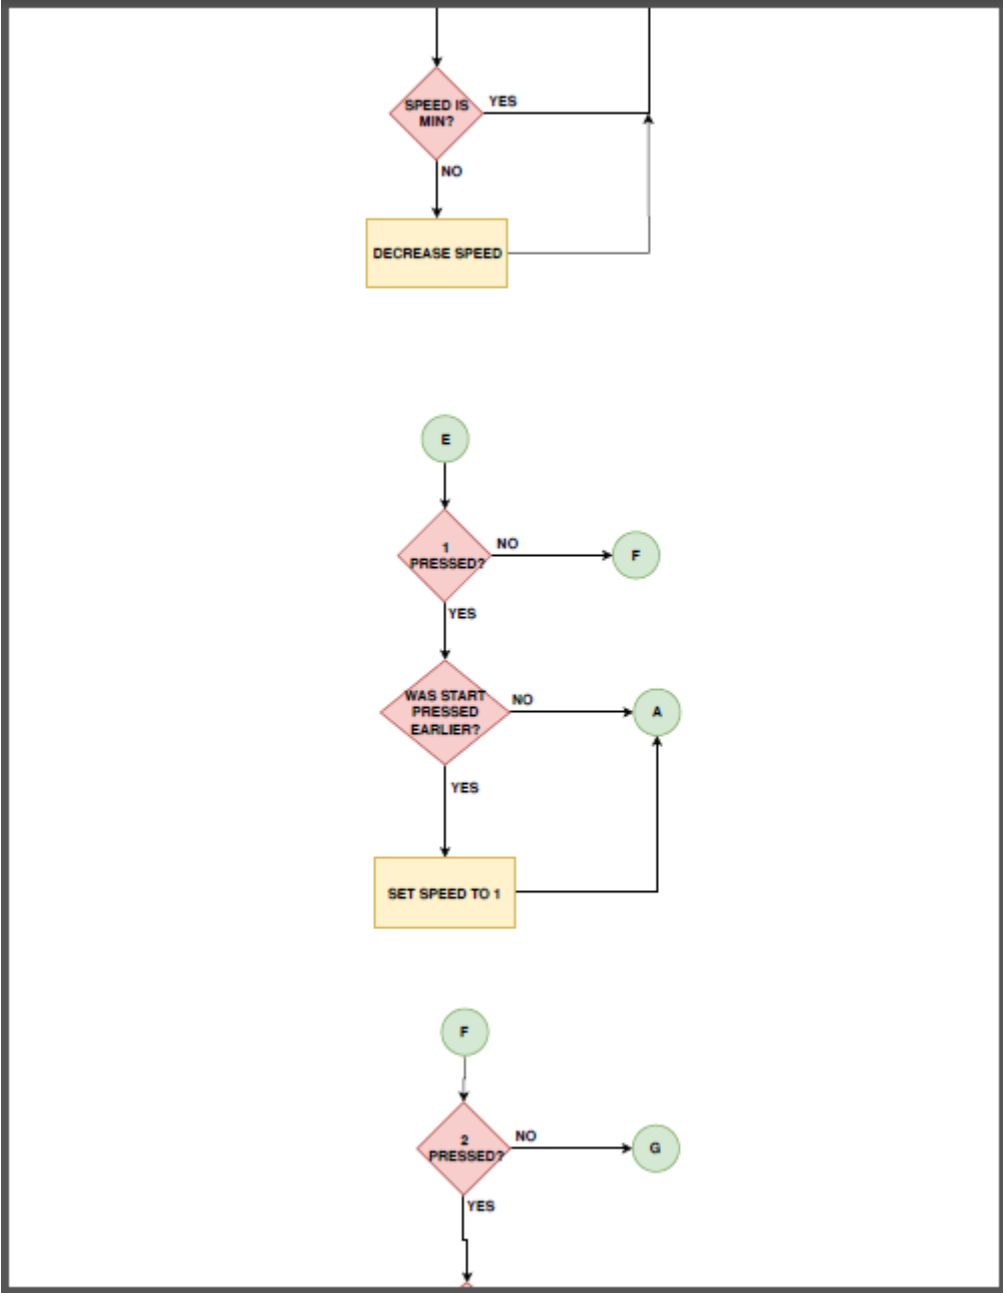

Component	Address Mapping	Details
ROM	00000H-01FFFH	8KB ROM USING TWO 4KB CHIPS (EVEN AND ODD BANK)
RAM	02000H-02FFFH	4KB RAM USING TWO 2KB CHIPS(EVEN AND ODD BANK)
PORT A (8255-(1))	00H	OUTPUT(DC FAN)
PORT B (8255-(1))	02H	CONTROL SIGNALS(clock, reset)
PORT C (8255-(1))	04H	KEYPAD
CONTROL REGISTER (8255-(1))	06H	FOR LOADING CONTROL WORD
COUNTER 0 (8253)	08H	USED FOR COUNTER 0
CONTROL REGISTER(8253)	0EH	FOR LOADING CONTROL WORD
PORT A (8255-(2))	10H	TIME INPUT
PORT B (8255-(2))	12H	UNUSED
PORT C (8255-(2))	14H	UNUSED
CONTROL REGISTER (8255-(2))	16H	FOR LOADING CONTROL WORD
